

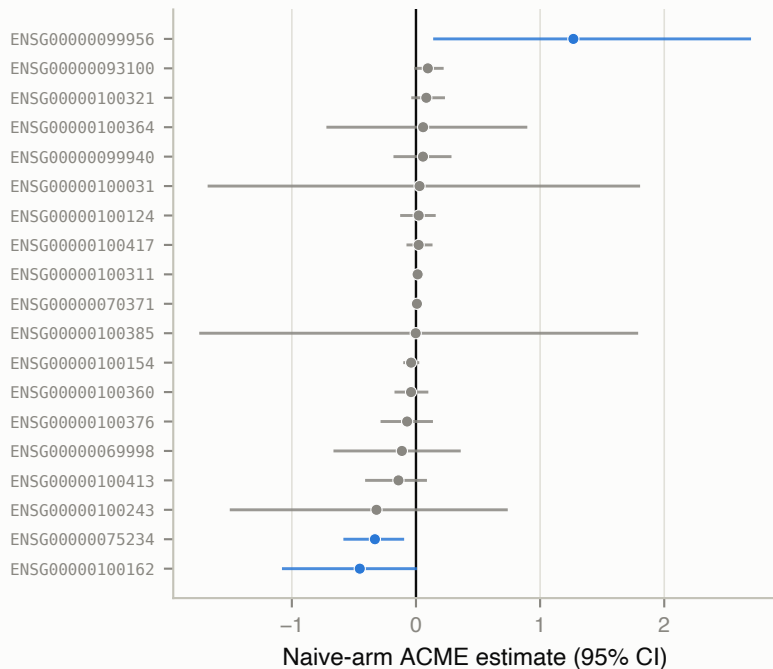

Figure 5. The naive SAE-mediation pipeline finds nothing survivable, against a real and strongly-detected genetic signal

A. All 19 ACME-reportable loci — 0/19 significant after BH, 3/19 at raw $p < 0.05$ (blue), all 19 independently flagged spurious

B. The underlying genetic signal is real and strong — total-effect significant at 18/19 loci (raw $p < 0.05$). Naive-arm ACME: 3/19 raw-significant, 0/19 after BH.
